* ** **Getting into Photoshop****. From the front screen of Photoshop, you can use a number of tools for editing images. You can zoom in or out, change the range of your image, and move, rotate, and copy images, adjust color, or perform many other editing tasks with the tools shown in the following figure. If you change the settings of an image, you change it for good. The front screen of Photoshop, shown in Figure 5-1, offers these major areas: Figure 5-1. The front screen of Photoshop has three major areas: the name of the document, the image area, and the workspace. The name of the document is the unique name that you give your image and which appears on the lower-left corner of the window. The document window is the area where you work on your image. The workspace area features the tools that help you work with layers. The _image area_ is the area where you work on your image and where you see your image as a raster-based document. (If your original image is a JPEG, you can see a preview of your image, which may or may not show you the changes you've made. For uncompressed images, you get a preview of the image as a pixel-based grayscale image with the color values shown in the colorspace palette, as shown in Figure 5-2. For a sample of a work-in-progress, see "The Touch of Photoshop" on this book's Missing CD page at www.missingmanuals.com. You see the image in the image area when you first open a new document. When you first open a document, you see a preview of the image, usually showing up in the same window where you've opened the document. After you've opened a new document, Photoshop makes that document available to you in the workspace, shown on the left in Figure 5-2, on the bottom toolbar. The default workspace is set to the Image Trace, as shown in Figure 5-2, but you can change it any time you like.

Q: Cannot get value from scikit build in Keras. ValueError: Can only convert a 1d array into a Tensor. I am new to Keras and trying to do binary classification of flower images. I want to make cross_entropy loss and binary_cross_entropy loss. but this error is coming: ValueError: Can only convert a 1d array into a Tensor. x_train = X_train.toarray() y_train = Y_train.astype('float32') model.compile(loss=keras.losses.binary_crossentropy, optimizer='adam', metrics=keras.metrics.binary_accuracy) model.fit(x_train, y_train, epochs=100, batch_size=256) I am getting the error at this line: model.fit(x_train, y_train, epochs=100, batch_size=256) The error log shows that the problem is in this line: model.fit(x_train, y_train, epochs=100, batch_size=256) A: In general, when keras is having an error, the solution is to find where it is originated by printing out: model.summary() and then: print(model.summary()) to print out all lines that may mention the error (such as deprecated or unsupported). Then, these lines can then be simply checked to see if they are causing the problem (usually it's in one of these lines): print(model.loss.shape) # shape: (28, 28, 3) That usually gives you the shape of your data which clearly is not 1D (as the error clearly mentions). not be called 'fiat' addresses. Q: How to read a txt file and make it into a dictionary python 2.7 File.txt abstract meaning is isn't noun adjective verb adverb adjective noun article conjunction I would like to read this file and make it so I can print every letter in the file as a word but then use it to find the next word and check to see if it is different. For example, if i was to print the word is it would be because is is a word found. But if I were to print the word abstract I would get the word abstract because abstract and abstract are two different words. What I have is with open('File.txt', 'r') as file: fileText = file.read() fileText = fileText.split() fileText = [x.lower() for x in fileText] This makes the fileText into a list and it uses lower() to make it all lower case. How do I use the lowerCase letters to actually make the dictionary? This is what I have done so far. for word in fileText: if "is" in word: print word, word.lower() I want to print every word in the dictionary and it prints the word abstract and it is. So this is what I have to do Print every word in the dictionary and make sure abstract is in there Compare the words to see if abstract or abstract is in there A: You have a list. You can iterate over a list like this: for word in fileText: if "is" in word: print word, word.lower() I suggest the following: with open("File.txt", "r") as file: fileText = file.read().split() #make sure to "read().split()" fileText = [x.lower() for x in
